

Using it on systems of school

We recommend you to read, installation guide and Operating Manual first.

1. First, **Run** this software on any one of the PC.
2. Put the duty of any student or staff member to feed name of every Post in the election. (refer operation manual, to know how to feed posts).
3. Introduce one of the day before the day of election, as registration day.
4. That day, one by one, each selected candidate will come to lab and register him/her self on the system. (refer operation manual, to know how to register).
5. This is similar to real time election which is held in our country, where politicians go to registration office and register themselves for elections.
6. This will also help candidates to get real time experience.
7. The **same system** should be used for **feeding Posts** and **registration of candidates**.
8. After all the process is over, lets prepare for Election Day.
9. Every data, even registration form is stored inside **RGEVS** folder in C drive, created by software for its utility purpose.

10. Now the RGEVS folder of this system contains filled forms and Post names.

11. Now copy that RGEVS folder from the system which was used to feed posts and register candidates, and paste it inside C drive of every system which will be used for voting.
12. You must do the copy process using a secure method to protect files. i.e. either write RGEVS folder on a CD drive and do the process of pasting with it. Or paste this folder in a drive connected to server, and then paste it C drive of every system.
13. Note: RGEVS folder should be present in C drive of every system. And same RGEVS folder to be pasted on other systems as it contains filled forms of all candidates.
